(NDT) Nondestructive Testing

Liquid Penetrant Testing

Magnetic Particle Testing

Nondestructive Testing (NDT) is a quality control inspection that does not damage or destroy the materials or objects being tested. It's the most reliable way to test equipment for defects from fatigue, structural flaws, and other problems that could lead to serious injury and or the costly shutdown of your facility.

Hoosier Crane performs two of the main types of nondestructive testing, magnetic particle testing and liquid penetrant testing. Both are much more precise than basic observation inspections.

Our service technicians are certified and experienced in these testing methods. They are prepared to give your equipment the most accurate and reliable evaluations possible.

Potential Problems Detected

NDT Inspections detect problems that you just can't see with a routine visual inspection. Our inspectors will provide you with digital photos of every piece of equipment we inspect. We will explain the problems or potential problems and offer you solutions.

Contact Us

Schedule our Nondestructive Testing service today to ensure the safe and efficient operation of your equipment and assets. You will also ensure the safety of all your employees.
